ITALY

NAME/LABEL:
VANGER BULL RED HURRICANE
SPECIES: DOG
BREED: STAFFORDSHIRE BULL TERRIER
SEX: MALE
MICROCHIP NO.: 938000000841411
TATOO NO.: NOT PROVIDED
PEDIGREE NO.: LO20153887

GENETIC REPORT

SAMPLE: ISOLATED DNA
SAMPLE TAKEN BY: ALICE AMBROSETTI, DVM
REQUESTED TEST: HEREDITARY CATARACT (HSF4)
RESULT: CLEAR (WT/WT)
COMMENT :
The test examines presence or absence of HSF4 gene mutation (g.85286582–85286583insC) described as the cause of primary hereditary cataract (HC) in Staffordshire Bull Terrier, Boston Terrier and French Bulldog. The disease is characterized by opacity of the crystalline lens, which leads to blindness. Tested HSF4 gene defect is inherited as an autosomal recessive trait.
Regarding to the presence of tested mutation animals are classified in three groups:
• Clear (wt/wt) - mutation is not present, normal genotype
• Carrier (mut/wt) - one of two alleles carries tested mutation, disease is not clinically manifested
• Affected (mut/mut) - both alleles carry tested mutation, disease is clinically manifested
For each group different breeding strategies should be followed. Breeding of affected and carrier animals should be avoided. If particularly valuable animal is classified as affected, it should be bred only with clear animal. In such case, all first generation siblings will be carriers. If a carrier is bred with clear animal, 50% of siblings are expected to be clear. In case two carriers are bred, 25% of siblings are expected to be clear and 50% are expected to be carriers. However, 25% of siblings are expected to be affected, therefore such breeding practice is discouraged.

AUTHORIZED SIGNATURE: MARIBOR, 31.12.2021

Results are valid for laboratory analysed samples only. Accuracy of the data about animal identity is the sole responsibility of the customer/owner. Laboratory is not responsible for false results which arise due to inaccurate animal identity data, false sample labels etc. To the extent the law allows, the maximal compensation for potential false result is limited to the invoiced amount. With the test it is not possible to rule out the presence of other genetic changes which might affect the development of the disease. Testing is performed according to the latest scientific knowledge.

GENETIC REPORT

SAMPLE: ISOLATED DNA

SAMPLE TAKEN BY: ALICE AMBROSETTI, DVM

REQUESTED TEST: L-2-HYDROXYGLUTARIC ACIDURIA (L-2-HGA)

RESULT: CLEAR (WT/WT)

COMMENT :

The test examines presence or absence of L2HGDH gene mutation (c.1297T>C, c.1299C>T) described as the cause of L-2-hydroxyglutaric aciduria (L-2-HGA) in Staffordshire Bull Terrier. The disease is characterized by accumulation of L-2-hydroxyglutaric acid in urine, plasma and cerebrospinal fluid. It is manifested with a variety of clinical neurological deficits, including psychomotor retardation, seizures and ataxia. Tested L2HGDH gene mutation is inherited as an autosomal recessive trait.

Regarding to the presence of tested mutation animals are classified in three groups:

- Clear (wt/wt) - mutation is not present, normal genotype
- Carrier (mut/wt) - one of two alleles carries tested mutation, disease is not clinically manifested
- Affected (mut/mut) - both alleles carry tested mutation, disease is clinically manifested

For each group different breeding strategies should be followed. Breeding of affected and carrier animals should be avoided.
